POLICY STATEMENT

Children, Adolescents, and the Media

abstract

FREE

Media, from television to the “new media” (including cell phones, iPads, and social media), are a dominant force in children’s lives. Although television is still the predominant medium for children and adolescents, new technologies are increasingly popular. The American Academy of Pediatrics continues to be concerned by evidence about the potential harmful effects of media messages and images; however, important positive and prosocial effects of media use should also be recognized. Pediatricians are encouraged to take a media history and ask 2 media questions at every well-child visit: How much recreational screen time does your child or teenager consume daily? Is there a television set or Internet-connected device in the child’s bedroom? Parents are encouraged to establish a family home use plan for all media. Media influences on children and teenagers should be recognized by schools, policymakers, product advertisers, and entertainment producers. *Pediatrics* 2013;132:958–961

INTRODUCTION

Media, from traditional television to the “new media” (including cell phones, iPads, and social media), are a dominant force in children’s lives. Although media are not the leading cause of any major health problem in the United States, the evidence is now clear that they can and do contribute substantially to many different risks and health problems and that children and teenagers learn from, and may be negatively influenced by, the media. However, media literacy and prosocial uses of media may enhance knowledge, connectedness, and health. The overwhelming penetration of media into children’s and teenagers’ lives necessitates a renewed commitment to changing the way pediatricians, parents, teachers, and society address the use of media to mitigate potential health risks and foster appropriate media use.

According to a recent study, the average 8- to 10-year-old spends nearly 8 hours a day with a variety of different media, and older children and teenagers spend >11 hours per day.¹ Presence of a television (TV) set in a child’s bedroom increases these figures even more, and 71% of children and teenagers report having a TV in their bedroom.¹ Young people now spend more time with media than they do in school—it is the leading activity for children and teenagers other than sleeping.^{1,2}

In addition to time spent with media, what has changed dramatically is the media landscape.^{3,4} TV remains the predominant medium (>4 hours per day) but nearly one-third of TV programming is viewed on alternative platforms (computers, iPads, or cell phones). Nearly all children and teenagers have Internet access (84%), often high-speed, and one-third have

FROM THE AMERICAN ACADEMY OF PEDIATRICS

access in their own bedroom. Computer time accounts for up to 1.5 hours per day; half of this is spent in social networking, playing games, or viewing videos. New technology has arrived in a big way: some 75% of 12- to 17-year-olds now own cell phones, up from 45% in 2004. Nearly all teenagers (88%) use text messaging. Teenagers actually talk less on their phones than any other age group except for senior citizens,^{5,6} but in the first 3 months of 2011, teenagers 13 through 17 years of age sent an average of 3364 texts per month.⁵ Half of teenagers send 50 or more text messages per day, and one-third send more than 100 per day.⁵ Teenagers access social media sites from cell phones,⁶ and as reviewed in a recent clinical report from the American Academy of Pediatrics (AAP), social media, mainly Facebook, offers opportunities and potential risks to young wired users.⁷ They are also avid multitaskers, often using several technologies simultaneously,¹ but multitasking teenagers are inefficient.⁸ For example, using a mobile phone while driving may result in both poor communication and dangerous driving.⁹

Despite all of this media time and new technology, many parents seem to have few rules about use of media by their children and adolescents. In a recent study, two-thirds of children and teenagers report that their parents have “no rules” about time spent with media.¹ Many young children see PG-13 and R-rated movies—either online, on TV, or in movie theaters—that contain problematic content and are clearly inappropriate for them.^{10,11} Few parents have rules about cell phone use for their children or adolescents. More than 60% of teenagers send and/or receive text messages after “lights out,” and they report increased levels of tiredness, including at school.¹² One study found that 20% of adolescents either sent or received a sexually explicit image by cell phone or Internet.¹³

For nearly 3 decades, the AAP has expressed concerns about the amount of time that children and teenagers spend with media and about some of the content they view. In a series of policy statements, the AAP has delineated its concerns about media violence,¹⁴ sex in the media,¹⁰ substance use,¹¹ music and music videos,¹⁵ obesity and the media,¹⁶ and infant media use.¹⁷ At the same time, existing AAP policy discusses the positive, prosocial uses of media and the need for media education in schools and at home.¹⁸ Shows like “Sesame Street” can help children learn numbers and letters, and the media can also teach empathy, racial and ethnic tolerance, and a whole variety of interpersonal skills.¹⁹ Prosocial media may also influence teenagers. Helping behaviors can increase after listening to prosocial (rather than neutral) song lyrics, and positive information about adolescent health is increasingly available through new media, including YouTube videos and campaigns that incorporate cell phone text messages.²⁰

RECOMMENDATIONS FOR PEDIATRICIANS AND OTHER HEALTH CARE PROVIDERS

- Become educated about critical media topics (media use, violence, sex, obesity, substance use, new technology) via continuing medical education programs.
- Ask 2 media questions and provide age-appropriate counseling for families at every well-child visit: How much recreational screen time does your child or teenager consume daily? Is there a TV set or an Internet-connected electronic device (computer, iPad, cell phone) in the child’s or teenager’s bedroom? In a busy clinic or office, these 2 targeted questions are key. There is considerable evidence that a bedroom TV increases the risk for obesity, substance use, and exposure to sexual content.^{1,21–26}

- Take a more detailed media history with children or teenagers who demonstrate aggressive behavior; are overweight or obese; use tobacco, alcohol, or other drugs; or have difficulties in school.
- Examine your own media use habits; pediatricians who watch more TV are less likely to advise families to follow AAP recommendations.²⁷

PEDIATRICIANS SHOULD RECOMMEND THE FOLLOWING TO PARENTS

- Limit the amount of total entertainment screen time to <1 to 2 hours per day.
- Discourage screen media exposure for children <2 years of age.
- Keep the TV set and Internet-connected electronic devices out of the child’s bedroom.
- Monitor what media their children are using and accessing, including any Web sites they are visiting and social media sites they may be using.
- Coview TV, movies, and videos with children and teenagers, and use this as a way of discussing important family values.
- Model active parenting by establishing a family home use plan for all media. As part of the plan, enforce a mealtime and bedtime “curfew” for media devices, including cell phones. Establish reasonable but firm rules about cell phones, texting, Internet, and social media use.

RECOMMENDATIONS FOR SCHOOLS

Community-based pediatricians, especially those serving in an advisory role to schools, are influential voices in school and neighborhood forums and can work to encourage a team approach among the medical home, the school home, and the family home. So pediatricians, especially

Unit 2: Lesson 1

AAP Policy Statement: “Children, Adolescents, and the Media”

those serving as school physicians or school medical advisors should:

- Educate school boards and school administrators about evidence-based health risks associated with unsupervised, unlimited media access and use by children and adolescents, as well as ways to mitigate those risks, such as violence prevention, sex education, and drug use-prevention programs.
- Encourage the continuation and expansion of media education programs, or initiate implementation of media education programs in settings where they are currently lacking.
- Encourage innovative use of technology where it is not already being used, such as online education programs for children with extended but medically justified school absences.
- Work collaboratively with parent-teacher associations to encourage parental guidance in limiting or monitoring age-appropriate screen times. In addition, schools that do use new technology like iPads need to have strict rules about what students can access.

PEDIATRICIANS SHOULD WORK WITH THE AAP AND LOCAL CHAPTERS TO CHALLENGE THE ENTERTAINMENT INDUSTRY TO DO THE FOLLOWING

- Establish an ongoing dialogue with health organizations like the AAP, the American Medical Association, the American Psychological Association, and the American Public Health Association to maximize prosocial content in media and minimize harmful effects (eg, portrayals of smoking, violence, etc).

- Make movies smoke-free, without characters smoking or product placement.¹¹

PEDIATRICIANS SHOULD WORK WITH THE AAP AND LOCAL CHAPTERS TO CHALLENGE MANUFACTURERS OF PRODUCTS WITH PUBLIC HEALTH IMPLICATIONS (TOBACCO, ALCOHOL, FOOD) TO DO THE FOLLOWING

- Make socially responsible decisions on marketing products to youth; betterment of their health is the ultimate goal.

PEDIATRICIANS SHOULD WORK WITH THE AAP AND LOCAL CHAPTERS TO CHALLENGE THE FEDERAL GOVERNMENT TO DO THE FOLLOWING

- Advocate for a federal report within either the National Institutes of Health or the Institute of Medicine on the impact of media on children and adolescents that would establish a baseline of what is currently known and what new research needs to be conducted.
- Encourage the entertainment industry and the advertising industry to create more prosocial programming and to reassess the effects of their current programming.
- Issue strong regulations—self-regulation is not likely to work—that would restrict the advertising of junk food and fast food to children and adolescents.
- Establish an ongoing funding mechanism for new media research.

- Initiate legislation and rules that would ban alcohol advertising from television.¹¹
- Work with the Department of Education to support the creation and implementation of media education curricula for schoolchildren and teenagers.

Text-Dependent Questions:

Introduction to the AAP Policy Statement:
“Children, Adolescents, and the Media”

Questions	Answers
<p>1. The statement begins by saying that although media does not cause health problems in children, the evidence is that media can contribute to those health problems. What is the difference between “causing” an outcome to happen and “contributing” to that outcome?</p>	
<p>2. The text states we must “change the way pediatricians, parents, teachers, and society address the use of media to mitigate potential health risks and foster appropriate media use.” Using the context of the sentence, find synonyms for the words <i>mitigate</i> and <i>foster</i>.</p>	
<p>3. What is the significant change being described in Paragraph 2?</p>	
<p>4. Paragraph 3 uses several pieces of evidence to illustrate the fact that the “media landscape has changed dramatically”: in other words, that the types of media being used by children have become very diverse. Choose one of these pieces of evidence and describe how it supports the fact.</p>	
<p>5. Paragraph 4 documents that many parents and families do not have guidelines in place for use of media. Why would the AAP feel the need to include this information in the introduction to its policy statement?</p>	
<p>6. Paragraph 5 summarizes the statements the AAP has already made about media and children. Name one concern the AAP has about media and children, and one benefit the AAP has noted.</p>

Explanation of the AAP Recommendation Process

Researchers identify problems they want to study and seek funding from private and public (like the federal government) sources.

Researchers publish findings in medical journals, and other researchers try to replicate and test their findings. They also present their findings at conferences. This is called the peer review process.

The American Academy of Pediatrics appoints an Expert Advisory Committee to comb through medical journals and find those studies that have been peer-reviewed and proved to be sound. The Expert Advisory Committee focuses on one specific aspect of pediatric care and is made up of experts in that field.

The Expert Advisory Committee decides what recommendation should be made using several criteria. Among the questions members ask themselves:

1. How strong is the evidence that this recommendation should be made?
2. What is the balance between potential harm and potential benefit?
3. What has been recommended before? Is there new information that should change the existing recommendation?
4. How important is this to public health? How many people will this affect?
5. How likely is this recommendation going to address the health problem?

Finally the Expert Advisory Committee writes the recommendation, and the AAP disseminates the information to physicians and the public.

Unit 2: Lesson 1
Assessing Sources

Name:

Date:

When you find a text you think you might use for research, you first need to assess it by asking these questions.

1. Assess the Text’s Accessibility

- Am I able to read and comprehend the text easily?
- Do I have adequate background knowledge to understand the terminology, information, and ideas in the text?

2. Assess the Text’s Credibility and Accuracy

- Is the author an expert on the topic?
- Is the purpose to inform or to persuade/sell?
- When was the text first published?
- How current is the information on the topic?
- Does the text have specific facts and details to support the ideas?
- Does the information in this text expand on or contradict what I already know about the topic?

3. Assess the Text’s Relevance

- Does the text have information that helps me answer my research questions? Is it information that I don’t have already?
- How does the information in the text relate to other texts I have found?

Informed by “Assessing Sources,” designed by Odell Education

 Neurologist’s Notebook #6

The AAP Policy Statement: “Children, Adolescents, and the Media”

Name: _____

Date: _____

Read this quote from the AAP policy statement:

“They [teenagers] are also avid multitaskers, often using several technologies simultaneously, but multitasking teenagers are inefficient. For example, using a mobile phone while driving may result in both poor communication and dangerous driving.”

How could the following aspects of adolescent neurology possibly explain, or connect to, the phenomenon described above?

Adolescent Neurology	How It Might Connect to the AAP Quote
The still-developing pre-frontal cortex	
The dopamine-based limbic system (also called the “risk/reward system”)	

Unit 2: Lesson 2
Beyond the Brain

By David Brooks

1. It's a pattern as old as time. Somebody makes an important scientific breakthrough, which explains a piece of the world. But then people get caught up in the excitement of this breakthrough and try to use it to explain everything.
2. This is what's happening right now with neuroscience. The field is obviously incredibly important and exciting. From personal experience, I can tell you that you get captivated by it and sometimes go off to extremes, as if understanding the brain is the solution to understanding all thought and behavior.
3. This is happening at two levels. At the lowbrow level, there are the conference circuit neuro-mappers. These are people who take pretty brain-scan images and claim they can use them to predict what product somebody will buy, what party they will vote for, whether they are lying or not, or whether a criminal should be held responsible for his crime.
4. At the highbrow end, there are scholars and theorists that some have called the "nothing buttists." Human beings are nothing but neurons, they assert. Once we understand the brain well enough, we will be able to understand behavior. We will see the chain of physical causations that determine actions. We will see that many behaviors like addiction are nothing more than brain diseases. We will see that people don't really possess free will; their actions are caused by material processes emerging directly out of nature. Neuroscience will replace psychology and other fields as the way to understand action.
5. These two forms of extremism are refuted by the same reality. The brain is not the mind. It is probably impossible to look at a map of brain activity and predict or even understand the emotions, reactions, hopes and desires of the mind.
6. The first basic problem is that regions of the brain handle a wide variety of different tasks. As Sally Satel and Scott O. Lilienfeld explained in their compelling and highly readable book, "Brainwashed: The Seductive Appeal of Mindless Neuroscience," you put somebody in an fMRI machine and see that the amygdala or the insula lights up during certain activities. But the amygdala lights up during fear, happiness, novelty, anger or sexual arousal (at least in women). The insula plays a role in processing trust, insight, empathy, aversion and disbelief. So what are you really looking at?

Unit 2: Lesson 2
Beyond the Brain

By David Brooks

7. Then there is the problem that one activity is usually distributed over many different places in the brain. In his book, “Brain Imaging,” the Yale biophysicist Robert Shulman notes that we have this useful concept, “working memory,” but the activity described by this concept is widely distributed across at least 30 regions of the brain. Furthermore, there appears to be no dispersed pattern of activation that we can look at and say, “That person is experiencing hatred.”
8. Then there is the problem that one action can arise out of many different brain states and the same event can trigger many different brain reactions. As the eminent psychologist Jerome Kagan has argued, you may order the same salad, but your brain activity will look different, depending on whether you are drunk or sober, alert or tired.
9. Then, as Kagan also notes, there is the problem of meaning. A glass of water may be more meaningful to you when you are dying of thirst than when you are not. Your lover means more than your friend. It’s as hard to study neurons and understand the flavors of meaning as it is to study Shakespeare’s spelling and understand the passions aroused by Macbeth.
10. Finally, there is the problem of agency, the problem that bedevils all methods that mimic physics to predict human behavior. People are smokers one day but quit the next. People can change their brains in unique and unpredictable ways by shifting the patterns of their attention.
11. What Satel and Lilienfeld call “neurocentrism” is an effort to take the indeterminacy of life and reduce it to measurable, scientific categories.
12. Right now we are compelled to rely on different disciplines to try to understand behavior on multiple levels, with inherent tensions between them. Some people want to reduce that ambiguity by making one discipline all-explaining. They want to eliminate the confusing ambiguity of human freedom by reducing everything to material determinism.
13. But that is the form of intellectual utopianism that always leads to error. An important task these days is to harvest the exciting gains made by science and data while understanding the limits of science and data. The next time somebody tells you what a brain scan says, be a little skeptical. The brain is not the mind.

<p>Is this evidence relevant?</p> <p>Yes / No</p> <p>Explain why this evidence is or is not relevant to the claim:</p> <p>If ...</p> <p>Then ... you cannot predict from a person’s brain scan what is happening to the person.</p>	<p>Is this evidence relevant?</p> <p>Yes / No</p> <p>Explain why this evidence is or is not relevant to the claim:</p> <p>If ...</p> <p>Then ... you cannot predict from a person’s brain scan what is happening to the person.</p>	<p>Is this evidence relevant?</p> <p>Yes / No</p> <p>Explain why this evidence is or is not relevant to the claim:</p> <p>If ...</p> <p>Then ... you cannot predict from a person’s brain scan what is happening to the person.</p>
---	---	---

Part 2

<p>Did the author provide sufficient evidence? Explain why or why not.</p>
<p>Was the reasoning sound? Explain why or why not.</p>
<p>Overall, does the author successfully prove the claim? Why or why not? Refer to what you wrote above about relevant and sufficient evidence and sound reasoning.</p>

Unit 2: Lesson 3
“Is Google Making Us Stupid?”

YES: Nicholas Carr, author of *The Shallows: What the Internet Is Doing to Our Brains*

Who doesn't love Google? In the blink of an eye, the search engine delivers useful information about pretty much any subject imaginable. I use it all the time, and I'm guessing you do too. But I worry about what Google is doing to our brains. What really makes us intelligent isn't our ability to find lots of information quickly. It's our ability to think deeply about that information. And deep thinking, brain scientists have discovered, happens only when our minds are calm and attentive. The greater our concentration, the richer our thoughts. If we're distracted, we understand less, remember less, and learn less.

That's the problem with Google—and with the Internet in general. When we use our computers and our cellphones all the time, we're always distracted. The Net bombards us with messages and other bits of data, and every one of those interruptions breaks our train of thought. We end up scatterbrained. The fact is, you'll never think deeply if you're always Googling, texting, and surfing.

Google doesn't want us to slow down. The faster we zip across the Web, clicking links and skimming words and pictures, the more ads Google is able to show us and the more money it makes. So even as Google is giving us all that useful information, it's also encouraging us to think superficially. It's making us shallow.

If you're really interested in developing your mind, you should turn off your computer and your cellphone—and start thinking. Really thinking. You can Google all the facts you want, but you'll never Google your way to brilliance.

NO: Peter Norvig, director of research, Google Inc.

Any new information technology has both advocates and critics. More than 2,000 years ago, the classical Greek philosopher Socrates complained that the new technology of writing "will create forgetfulness in the learners' souls because they will not use their memories."

Today, Google is the new technology. The Internet contains the world's best writing, images, and ideas; Google lets us find the relevant pieces instantly.

Suppose I'm interested in the guidance computers on Apollo spacecraft in the 1960s. My local library has no books on that specific subject—just 18 books about the Apollo missions in general. I could hunt through those or turn to Google, which returns 45,000 pages, including a definitive encyclopedia article and instructions for building a unit.

Just as a car allows us to move faster and a telescope lets us see farther, access to the Internet's information lets us think better and faster. By considering a wide range of information, we can arrive at more creative and informed solutions. Internet users are more likely to be exposed to a diversity of ideas. In politics, for example, they are likely to see ideas from left and right, and see how news is reported in other countries.

There's no doubt the Internet can create distractions. But 81 percent of experts polled by the Pew Internet Research Project say the opportunities outweigh the distractions. Socrates was wrong to fear the coming of the written word: Writing has improved our law, science, arts, culture, and our memory. When the history of our current age is written, it will say that Google has made us smarter—both individually and collectively—because we have ready and free access to information.

Researcher’s Roadmap

Name: _____

Date: _____

Good researchers stop often to look around and see where they are, check their maps, and set their course toward their final destination. They sometimes take side trips, but they use their route-finding tools to reach their destinations.

Unit 2: Lesson 4
Researcher's Notebook

This is your place to gather information, generate questions, and keep track of your findings as you complete this research project. This will help you practice for and write your position paper and demonstrate your progress toward the following learning targets:

- I can conduct short research projects to answer a question. (W.7.7)
- I can generate additional questions for further research. (W.7.7)
- I can gather relevant information from a variety of sources. (W.7.8)
- I can evaluate the credibility and accuracy of each source. (W.7.8)
- I can quote or paraphrase others' work while avoiding plagiarism. (W.7.8)
- I can use a variety of strategies to determine the meaning of unknown words or phrases. (L.7.4)

RESEARCH QUESTION(S): What are the potential benefits and risks of entertainment screen time, particularly to the development of teenagers?

The following pages will help you organize your notes on your sources and your ideas about them.

Unit 2: Lesson 4
 Researcher’s Notebook

Section 1

This text will help you learn information about screen time. This will help you begin to generate relevant questions about your topic.

Track the bibliographic information for this source. The first entry has been mostly filled out for you:

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

Quite a few parents have asked me, at talks I've given, about the advisability of their limiting their kids' computer play. Others have told me that they do limit their kids' computer play, or their total daily "screen time," in a tone that seemed to suggest that any reasonable parent would do that. People who have been reading this blog can probably guess my reaction. I have a very high opinion of children's abilities to make good choices about how to use their free time, as long as they really have choices. Some kids go through long periods of doing what seems like just one thing, and then some adults think there's something wrong, because they (the adults) would not make that choice. But in my experience, if kids are really free to play and explore in lots of different ways, and they end up playing or exploring in what seems to be just one way, then they are doing that because they are getting something really meaningful out of it. For a nice example of this, you might watch the film on the home page of the Sudbury Valley School website, where a young man describes his year of doing almost nothing but computer play.

It is always a mistake, I think, to tell kids what they must or must not do, except in those cases where you are telling them that they must do their share of the chores around the house or must not do things that hurt you or other people. Whenever we prevent our kids from playing or exploring in the ways they prefer, we place another brick in a barrier between them and us. We are saying, in essence, "I don't trust you to control your own life." Children are suffering today not from too much computer play or too much screen time. They are suffering from too much adult control over their lives and not enough freedom (see essay on rise of depression and anxiety).

Kids who are really free know what is best for them, especially concerning how they should spend their free time. Every kid is different, just as every adult is, and we can't get into their heads and find out just what they are getting out of something that we don't understand. I know well a kid who, for years, spent hours per day watching television shows that I thought were really disgustingly dumb; but, over time, I discovered that she was getting a lot out of them. They were making her think in new ways. She understood all the ways in which the shows were dumb, at least as well as I did; but she also saw ways in which they were smart, and she analyzed them and learned from them. They contributed greatly to her abilities as an actress (she eventually had major parts in high-school plays), because she acted out the parts vicariously, in

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

her mind, as she watched. They also contributed to her fascination with certain aspects of human psychology. She now wants to go into clinical psychology as a career.

I've also known kids who spent huge amounts of time reading—just sitting and reading, "doing nothing!" for maybe 10 hours a day. There were always some kids like that, even when I was a kid. I could never understand why they would want to just sit and read when they could go fishing with me instead. What a waste of time. However, I've never known a parent to limit their kids' reading time. Why is it any better to limit TV or computer time than to limit book-reading time? Why do we worry about a kid's spending maybe 4 or 5 hours a day at a computer screen, doing what he wants to do, but don't worry about the same kid sitting at school for 6 hours a day and then doing homework for another couple of hours—doing what others are forcing him to do? I ask you to consider the possibility that the kid is learning more valuable lessons at the computer than at school, in part *because* the computer activity is self-chosen and the school activity is not.

Computers are the most important tools of modern society. Why would we limit kids' opportunities to play with them?

Why would we want to limit a kid's computer time? The computer is, without question, the single most important tool of modern society. Our limiting kids' computer time would be like hunter-gatherer adults limiting their kids' bow-and-arrow time. Children come into the world designed to look around and figure out what they need to know in order to make it in the culture into which they are born. They are much better at that than adults are. That's why they learn language so quickly and learn about the real world around them so much faster than adults do. That's why kids of immigrant families pay more attention to the language spoken by their new peers, in the new culture, than to the old language spoken by their parents. That's also why, whenever there's a new technological innovation, kids learn how to use it more quickly than their parents do. They know, instinctively, what they must learn in order to succeed.

Why do we keep hearing warnings from "authorities"—including the American Academy of Pediatrics—that we must limit kids' computer play? Some of the fear mongering comes, I think, from a general tendency on the part of us older folks to distrust any new media. Plato, in *The Republic*, argued that plays and poetry should be banned because of their harmful

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

effects on the young. When writing came about and became technically easier, and was enthusiastically seized upon by the young, some of their elders warned that this would rot their minds; they would no longer have to exercise their memories. When printed novels became available to the masses, many warned that these would lead the young, especially girls and young women, to moral degeneracy. When televisions began to appear in people's homes, all sorts of dire warnings were sounded about the physical, psychological, and social damage they would cause.

Video games have been under attack by the fear-mongers ever since they first appeared, and the attacks have not diminished. If you Google around the Internet using *harmful effects of video games* as a search phrase, you will find all sorts of frightening claims. One site warns that video games can cause depression, physical aggression, poor sleep, somatic complaints, obesity, attention disorders, and ... the list went on. The only malady they seemed to have left out was housemaid's knee.

The most common complaints about video games are that they (1) are socially isolating, (2) reduce opportunities for outdoor activities and thereby lead to obesity and poor physical health, and (3) promote violence in kids, if the games have violent content. On the face of it, of course, the first two of these claims should be truer of book reading than of video gaming. Concerning the third claim, I don't see any obvious reason why pretend murder of animated characters in video games should be any more likely to provoke real murder than, say, reading Shakespeare's account of Hamlet's murder of his stepfather. Yet we *make* kids read Hamlet in school.

Research refutes the frightening myths about harmful effects of computer games.

If you look into the actual research literature, you find very little if any evidence supporting the fear-mongers claims, and considerable evidence against those claims. In fact, systematic surveys have shown that regular video-game players are, if anything, more physically fit, less likely to be obese, more likely to also enjoy outdoor play, more socially engaged, more socially well-adjusted, and more civic minded than are their non-gaming peers.[1] A large-scale study in four cities in Holland showed—contrary to what I assume was the initial hypothesis—that kids who had a computer and/or a television set in their own room were significantly *more* likely to play outside than were otherwise similar kids who didn't have such easy and private access to screen play.[2] A study by the Pew Research Center concluded that video games, far from being

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

socially isolating, serve to connect young people with their peers and to society at large.[3] Other research has documented, qualitatively, the many ways that video games promote social interactions and friendships.[4] Kids make friends with other gamers, both in person and online. They talk about their games with one another, teach one another strategies, and often play together, either in the same room or online.

Concerning violence, meta-analyses of the many studies designed to find effects of violent video games on real-world violence have concluded that, taken as a whole, there is precious little or no evidence at all of such effects.[5] It's interesting, also, to note that over the decades in which violent video gaming has been steadily rising, there has been a steady and large decline in real-world violence by youth.[6] I'm not about to claim that the decline in real-world violence is in any significant way caused by the rise in violent video games, but, there is some evidence that playing such games helps people learn how to control their hostility. In one experiment, college students were presented with a frustrating mental task and then were assessed for their feelings both of depression and hostility. The significant finding was that regular players of violent video games felt less depressed and less hostile 45 minutes after the frustrating experience than did otherwise similar students who didn't play such games.[7]

I have to admit that I personally hate graphic depictions of violence, in games or anywhere else, but I claim no moral virtue in that. I'm just squeamish. My wife and step-kids, who are every bit as nonviolent in real life as I am, tease me about it. They talk about screening movies for me, and they have gotten used to going to certain movies without me.

Video games have been shown to have many positive effects on brainpower.

Quite a few well-controlled research studies have documented positive effects of video games on mental development. Repeated experiments have shown that playing fast-paced action video games can quite markedly increase players' scores on tests of visuospatial ability, including tests that are used as components of standard IQ tests.[8] Other studies suggest that, depending on the type of game, video games can also increase scores on measures of working memory (the ability to

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

hold several items of information in mind at once), critical thinking, and problem solving.[9] In addition, there is growing evidence that kids who previously showed little interest in reading and writing are now acquiring advanced literacy skills through the text-based communication in online video games.[10]

When kids are asked, in focus groups and surveys, what they like about video games, they generally talk about freedom, self-direction, and competence.[11] In the game, they make their own decisions and strive to meet challenges that they themselves have chosen. At school and in other adult-dominated contexts they may be treated as idiots who need constant direction, but in the game they are in charge and can solve difficult problems and exhibit extraordinary skills. In the game, age does not matter, but skill does. In these ways, video games are like all other forms of true play.

The special benefits of MMORPGs

Over time, video games have become increasingly complex and multifaceted. Perhaps the most interesting games today are the so-called Massively Multiplayer Online Role Playing Games (MMORPGs), such as *World of Warcraft*, which are even more social than were previous video games and offer endless opportunities for creativity and problem solving.[12]

In these online games, players create a character (an avatar), which has unique physical and psychological traits and assets, and, with that character, enter a complex and exciting virtual world that is simultaneously occupied by countless other players, who in their real-life forms may be sitting anywhere on the planet. Players go on quests within this virtual world, and along the way they meet other players, who might become friends or foes. Players may start off playing solo, avoiding others, but to advance to the higher levels they have to make friends and join with others in mutual quests. Making friends within the game requires essentially the same skills as making friends in the real world. You can't be rude. You have to understand the etiquette of the culture you are in and abide by that etiquette. You have to learn about the goals of a potential friend and help that individual to achieve those goals. Depending on how you behave, players may put you on their *friends* list or their *ignore* list, and they may communicate positive or negative information about you to

Unit 2: Lesson 4
The Many Benefits, for Kids, of Playing Video Games
By Peter Gray

other players. The games offer players endless opportunities to experiment with different personalities and ways of behaving, in a fantasy world where there are no real-life consequences for failing.

Players in these games can also join special-interest groups called guilds. To join a guild, a player (or, more accurately, the player's avatar) must fill out an application form, much like a job application, explaining why he or she would be a valuable member. Guilds generally have structures that are similar to companies in the real world, with leaders, executive boards, and even recruitment personnel. Such games are, in many ways, like the imaginative sociodramatic games of preschool children, but played in a virtual world, with communication by online text, and raised up many notches in sophistication to fit the interests and abilities of the older children, teenagers, and adults who play them. Like all sociodramatic games, they are very much anchored in an understanding of the real world, and they exercise concepts and social skills that are quite relevant to that world. In fact, a study commissioned by the IBM Corporation concluded that the leadership skills exercised within MMORPGs are essentially the same as those required to run a modern company.[13]

Video Games Benefit Children, Study Finds

Children could be better off playing video games this holiday season than watching television, a QUT (Queensland University of Technology) study shows.

Dr. Penny Sweetser, Dr. Daniel Johnson and Dr. Peta Wyeth, from QUT's Games Research and Interaction Design (GRID) Lab, investigated the amount of time children spent watching television and DVDs compared to video game and computer use.

The paper, "Active versus Passive Screen Time for Young Children," published in the *Australian Journal for Early Childhood*, showed the majority of children aged two to five exceeded government recommendations of a maximum of one hour of "screen time" per day.

Their analysis of data from the Longitudinal Study of Australian Children found children in this age group spent, on average, some two to three hours watching television compared to less than a half hour playing video games or using computers.

Dr. Johnson said while watching television was a "passive" experience, video and computer games were interactive, with research showing it boosted children's self-esteem, cognitive skills such as problem-solving and, in some cases, physical activity levels.

"There is a lot of negative press about gaming and that's not well-supported. Where there is a negative effect, research shows it's on the minority of people," he said.

"Video games are a mainstream pastime. More than 92 percent of Australian homes have at least one device for playing video games.

"Emerging research has shown that active video games such as Nintendo Wii, Sony PlayStation Move, and the Xbox Kinect can be used to motivate young children to exercise and be more active outside of the game setting."

Dr. Sweetser said computer use and video game play should not be classed as the same type of activity as watching television.

She said screen-time recommendations, which are based on the sum of all screen-related activities, should be divided into two categories, active and passive screen time.

The research found active screen time involved cognitively or physically engaging screen-based activities, such as playing video games or completing homework on a computer.

"This distinction provides a more accurate classification of screen time and a better lens through which to consider the benefits and detrimental effects for young children," she said.

Dr. Sweetser said parents should monitor the amount of time and type of games children play on game consoles and computers.

"Clearly, certain forms of media such as violent video games are not appropriate for children, and games should be played in moderation," she said.

"Video games benefit children: study." Queensland University of Technology News, 11 Jan 2013. Queensland University of Technology, Brisbane, Australia. 11 May 2015. <https://www.qut.edu.au/news/news?news-id=54961>

Why Facebook Could Actually Be Good for Your Mental Health

By Sy Mukherjee

Go ahead—check those notifications. According to a new pilot study conducted by Dr. Alice Good of the University of Portsmouth, the vast majority of Facebook users use the social network to lift their spirits when they're feeling down by navigating their old photos and wall posts in which they've interacted with family and friends—a “self-soothing” coping mechanism somewhat akin to flipping through a photo album or watching old home videos.

Researchers argue that that could be a big boost for users who are prone to anxiety or depression by providing a healthy emotional conduit for reminiscing about the good times in one's life. The findings also shed new light into what, exactly, users are looking to achieve when they use social media to share their feelings and experiences:

Psychologist Dr. Clare Wilson, also of the University of Portsmouth, said: “Although this is a pilot study, these findings are fascinating.

“Facebook is marketed as a means of communicating with others. Yet this research shows we are more likely to use it to connect with our past selves, perhaps when our present selves need reassuring.

“The pictures we often post are reminders of a positive past event. When in the grip of a negative mood, it is too easy to forget how good we often feel. Our positive posts can remind us of this.”

Dr. Good's study has concluded that looking at comforting photos, known as reminiscent therapy, could be an effective method of treating mental health. [...]

The act of self-soothing is an essential tool in helping people to calm down, especially if they have an existing mental health condition.

The findings are particularly interesting given past studies that have indicated that Facebook users end up feeling depressed after a browsing session. For instance, one German study found that “one in three people felt worse after visiting the site and more dissatisfied with their lives, while people who browsed without contributing were affected the most.”

But those findings derived from users' envy at their *friends'* vacations, life milestones, and various successes. The new preliminary data from Dr. Good's study suggests that, used in a different way—i.e., actively “self-soothing” rather than passively sulking—browsing through one's Facebook history could be a net benefit. And that could be very good news from a global mental health perspective for the social network, which has over a billion users worldwide and counting.

3. Write the definition you chose here:

4. Explain how you determined that this is the correct definition:

Unit 2: Lesson 7

Attached to Technology and Paying the Price

By Matt Richtel

SAN FRANCISCO—When one of the most important e-mail messages of his life landed in his in-box a few years ago, Kord Campbell overlooked it.

Not just for a day or two, but 12 days. He finally saw it while sifting through old messages: a big company wanted to buy his Internet start-up.

“I stood up from my desk and said, ‘Oh my God, oh my God, oh my God,’” Mr. Campbell said. “It’s kind of hard to miss an e-mail like that, but I did.”

The message had slipped by him amid an electronic flood: two computer screens alive with e-mail, instant messages, online chats, a Web browser and the computer code he was writing. (While he managed to salvage the \$1.3 million deal after apologizing to his suitor, Mr. Campbell continues to struggle with the effects of the deluge of data. Even after he unplugs, he craves the stimulation he gets from his electronic gadgets. He forgets things like dinner plans, and he has trouble focusing on his family.

His wife, Brenda, complains, “It seems like he can no longer be fully in the moment.”

This is your brain on computers.

Scientists say juggling e-mail, phone calls and other incoming information can change how people think and behave. They say our ability to focus is being undermined by bursts of information.

These play to a primitive impulse to respond to immediate opportunities and threats. The stimulation provokes excitement—a dopamine squirt—that researchers say can be addictive. In its absence, people feel bored.

The resulting distractions can have deadly consequences, as when cellphone-wielding drivers and train engineers cause wrecks. And for millions of people like Mr. Campbell, these urges can inflict nicks and cuts on creativity and deep thought, interrupting work and family life.

While many people say multitasking makes them more productive, research shows otherwise. Heavy multitaskers actually have more trouble focusing and shutting out irrelevant information, scientists say, and they experience more stress.

And scientists are discovering that even after the multitasking ends, fractured thinking and lack of focus persist. In other words, this is also your brain *off* computers.

“The technology is rewiring our brains,” said Nora Volkow, director of the National Institute of Drug Abuse and one of the world’s leading brain scientists. She and other researchers compare the lure of digital stimulation less to that of drugs and alcohol than to food and sex, which are essential but counterproductive in excess.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

Technology use can benefit the brain in some ways, researchers say. Imaging studies show the brains of Internet users become more efficient at finding information. And players of some video games develop better visual acuity.

More broadly, cellphones and computers have transformed life. They let people escape their cubicles and work anywhere. They shrink distances and handle countless mundane tasks, freeing up time for more exciting pursuits.

For better or worse, the consumption of media, as varied as e-mail and TV, has exploded. In 2008, people consumed three times as much information each day as they did in 1960. And they are constantly shifting their attention. Computer users at work change windows or check e-mail or other programs nearly 37 times an hour, new research shows.

The nonstop interactivity is one of the most significant shifts ever in the human environment, said Adam Gazzaley, a neuroscientist at the [University of California, San Francisco](#).

“We are exposing our brains to an environment and asking them to do things we weren’t necessarily evolved to do,” he said. “We know already there are consequences.”

Mr. Campbell, 43, came of age with the personal computer, and he is a heavier user of technology than most. But researchers say the habits and struggles of Mr. Campbell and his family typify what many experience—and what many more will, if trends continue.

For him, the tensions feel increasingly acute, and the effects harder to shake.

The Campbells recently moved to California from Oklahoma to start a software venture. Mr. Campbell’s life revolves around computers. (He goes to sleep with a laptop or [iPhone](#) on his chest, and when he wakes, he goes online. He and Mrs. Campbell, 39, head to the tidy kitchen in their four-bedroom hillside rental in Orinda, an affluent suburb of San Francisco, where she makes breakfast and watches a TV news feed in the corner of the computer screen while he uses the rest of the monitor to check his e-mail.

Major spats have arisen because Mr. Campbell escapes into video games during tough emotional stretches. On family vacations, he has trouble putting down his devices. When he rides the subway to San Francisco, he knows he will be offline 221 seconds as the train goes through a tunnel.

Their 16-year-old son, Connor, tall and polite like his father, recently received his first C’s, which his family blames on distraction from his gadgets. Their 8-year-old daughter, Lily, like her mother, playfully tells her father that he favors technology over family.

“I would love for him to totally unplug, to be totally engaged,” says Mrs. Campbell, who adds that he becomes “crotchety until he gets his fix.” But she would not try to force a change.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

“He loves it. Technology is part of the fabric of who he is,” she says. “If I hated technology, I’d be hating him, and a part of who my son is too.”

Always On

Mr. Campbell, whose given name is Thomas, had an early start with technology in Oklahoma City. When he was in third grade, his parents bought him Pong, a video game. Then came a string of game consoles and PCs, which he learned to program.

In high school, he balanced computers, basketball and a romance with Brenda, a cheerleader with a gorgeous singing voice. He studied too, with focus, uninterrupted by e-mail. “I did my homework because I needed to get it done,” he said. “I didn’t have anything else to do.”

He left college to help with a family business, then set up a lawn mowing service. At night he would read, play video games, hang out with Brenda and, as she remembers it, “talk a lot more.”

In 1996, he started a successful Internet provider. Then he built the start-up that he sold for \$1.3 million in 2003 to LookSmart, a search engine.

Mr. Campbell loves the rush of modern life and keeping up with the latest information. “I want to be the first to hear when the aliens land,” he said, laughing. But other times, he fantasizes about living in pioneer days when things moved more slowly: “I can’t keep everything in my head.”

No wonder. As he came of age, so did a new era of data and communication.

At home, people consume 12 hours of media a day on average, when an hour spent with, say, the Internet and TV simultaneously counts as two hours. That compares with five hours in 1960, say researchers at the University of California, San Diego. Computer users visit an average of 40 Web sites a day, according to research by RescueTime, which offers time-management tools.

As computers have changed, so has the understanding of the human brain. Until 15 years ago, scientists thought the brain stopped developing after childhood. Now they understand that its neural networks continue to develop, influenced by things like learning skills.

So not long after Eyal Ophir arrived at Stanford in 2004, he wondered whether heavy multitasking might be leading to changes in a characteristic of the brain long thought immutable: that humans can process only a single stream of information at a time.

Going back a half-century, tests had shown that the brain could barely process two streams, and could not simultaneously make decisions about them. But Mr. Ophir, a student-turned-researcher, thought multitaskers might be rewiring themselves to handle the load.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

His passion was personal. He had spent seven years in Israeli intelligence after being weeded out of the air force—partly, he felt, because he was not a good multitasker. Could his brain be retrained?

Mr. Ophir, like others around the country studying how technology bent the brain, was startled by what he discovered.

The Myth of Multitasking

The test subjects were divided into two groups: those classified as heavy multitaskers based on their answers to questions about how they used technology, and those who were not.

In a test created by Mr. Ophir and his colleagues, subjects at a computer were briefly shown an image of red rectangles. Then they saw a similar image and were asked whether any of the rectangles had moved. It was a simple task until the addition of a twist: blue rectangles were added, and the subjects were told to ignore them. (The multitaskers then did a significantly worse job than the non-multitaskers at recognizing whether red rectangles had changed position. In other words, they had trouble filtering out the blue ones—the irrelevant information.

So, too, the multitaskers took longer than non-multitaskers to switch among tasks, like differentiating vowels from consonants and then odd from even numbers. The multitaskers were shown to be less efficient at juggling problems. (

Other tests at Stanford, an important center for research in this fast-growing field, showed multitaskers tended to search for new information rather than accept a reward for putting older, more valuable information to work.

Researchers say these findings point to an interesting dynamic: multitaskers seem more sensitive than non-multitaskers to incoming information.

The results also illustrate an age-old conflict in the brain, one that technology may be intensifying. A portion of the brain acts as a control tower, helping a person focus and set priorities. More primitive parts of the brain, like those that process sight and sound, demand that it pay attention to new information, bombarding the control tower when they are stimulated.

Researchers say there is an evolutionary rationale for the pressure this barrage puts on the brain. The lower-brain functions alert humans to danger, like a nearby lion, overriding goals like building a hut. In the modern world, the chime of incoming e-mail can override the goal of writing a business plan or playing catch with the children.

“Throughout evolutionary history, a big surprise would get everyone’s brain thinking,” said Clifford Nass, a communications professor at Stanford. “But we’ve got a large and growing group of people who think the slightest hint that something interesting might be going on is like catnip. They can’t ignore it.”

Unit 2: Lesson 7

Attached to Technology and Paying the Price

Mr. Nass says the Stanford studies are important because they show multitasking's lingering effects: "The scary part for guys like Kord is, they can't shut off their multitasking tendencies when they're not multitasking."

Melina Uncapher, a neurobiologist on the Stanford team, said she and other researchers were unsure whether the muddled multitaskers were simply prone to distraction and would have had trouble focusing in any era. But she added that the idea that information overload causes distraction was supported by more and more research.

A study at the University of California, Irvine, found that people interrupted by e-mail reported significantly increased stress compared with those left to focus. Stress hormones have been shown to reduce short-term memory, said Gary Small, a psychiatrist at the University of California, Los Angeles.

Preliminary research shows some people can more easily juggle multiple information streams. These "supertaskers" represent less than 3 percent of the population, according to scientists at the University of Utah.

Other research shows computer use has neurological advantages. In imaging studies, Dr. Small observed that Internet users showed greater brain activity than nonusers, suggesting they were growing their neural circuitry.

At the University of Rochester, researchers found that players of some fast-paced video games can track the movement of a third more objects on a screen than nonplayers. They say the games can improve reaction and the ability to pick out details amid clutter.

"In a sense, those games have a very strong both rehabilitative and educational power," said the lead researcher, Daphne Bavelier, who is working with others in the field to channel these changes into real-world benefits like safer driving.

There is a vibrant debate among scientists over whether technology's influence on behavior and the brain is good or bad, and how significant it is.

"The bottom line is, the brain is wired to adapt," said Steven Yantis, a professor of brain sciences at Johns Hopkins University. "There's no question that rewiring goes on all the time," he added. But he said it was too early to say whether the changes caused by technology were materially different from others in the past.

Mr. Ophir is loath to call the cognitive changes bad or good, though the impact on analysis and creativity worries him.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

He is not just worried about other people. Shortly after he came to Stanford, a professor thanked him for being the one student in class paying full attention and not using a computer or phone. But he recently began using an iPhone and noticed a change; he felt its pull, even when playing with his daughter.

“The media is changing me,” he said. “I hear this internal ping that says: check e-mail and voice mail.”

“I have to work to suppress it.”

Kord Campbell does not bother to suppress it, or no longer can.

Interrupted by a Corpse

It is a Wednesday in April, and in 10 minutes, Mr. Campbell has an online conference call that could determine the fate of his new venture, called Loggly. It makes software that helps companies understand the clicking and buying patterns of their online customers.

Mr. Campbell and his colleagues, each working from a home office, are frantically trying to set up a program that will let them share images with executives at their prospective partner.

But at the moment when Mr. Campbell most needs to focus on that urgent task, something else competes for his attention: “Man Found Dead Inside His Business.”

That is the tweet that appears on the left-most of Mr. Campbell’s array of monitors, which he has expanded to three screens, at times adding a laptop and an iPad.

On the left screen, Mr. Campbell follows the tweets of 1,100 people, along with instant messages and group chats. The middle monitor displays a dark field filled with computer code, along with Skype, a service that allows Mr. Campbell to talk to his colleagues, sometimes using video. The monitor on the right keeps e-mail, a calendar, a Web browser and a music player.

Even with the meeting fast approaching, Mr. Campbell cannot resist the tweet about the corpse. He clicks on the link in it, glances at the article and dismisses it. “It’s some article about something somewhere,” he says, annoyed by the ads for jeans popping up.

The program gets fixed, and the meeting turns out to be fruitful: the partners are ready to do business. A colleague says via instant message: “YES.”

Other times, Mr. Campbell’s information juggling has taken a more serious toll. A few weeks earlier, he once again overlooked an e-mail message from a prospective investor. Another time, Mr. Campbell signed the company up for the wrong type of business account on Amazon.com, costing \$300 a month for six months before he got around to correcting it. He has burned hamburgers on the grill, forgotten to pick up the children and lingered in the bathroom playing video games on an iPhone.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

Mr. Campbell can be unaware of his own habits. In a two-and-a-half hour stretch one recent morning, he switched rapidly between e-mail and several other programs, according to data from RescueTime, which monitored his computer use with his permission. But when asked later what he was doing in that period, Mr. Campbell said he had been on a long Skype call, and “may have pulled up an e-mail or two.”

The kind of disconnection Mr. Campbell experiences is not an entirely new problem, of course. As they did in earlier eras, people can become so lost in work, hobbies or TV that they fail to pay attention to family.

Mr. Campbell concedes that, even without technology, he may work or play obsessively, just as his father immersed himself in crossword puzzles. But he says this era is different because he can multitask anyplace, anytime.

“It’s a mixed blessing,” he said. “If you’re not careful, your marriage can fall apart or your kids can be ready to play and you’ll get distracted.”

The Toll on Children

Father and son sit in armchairs. Controllers in hand, they engage in a fierce video game battle, displayed on the nearby flat-panel TV, as Lily watches.

They are playing Super Smash Bros. Brawl, a cartoonish animated fight between characters that battle using anvils, explosives and other weapons.

“Kill him, Dad,” Lily screams. To no avail. Connor regularly beats his father, prompting expletives and, once, a thrown pillow. But there is bonding and mutual respect.

“He’s a lot more tactical,” says Connor. “But I’m really good at quick reflexes.”

Screens big and small are central to the Campbell family’s leisure time. Connor and his mother relax while watching TV shows like “Heroes.” Lily has an iPod Touch, a portable DVD player and her own laptop, which she uses to watch videos, listen to music and play games.

Lily, a second-grader, is allowed only an hour a day of unstructured time, which she often spends with her devices. The laptop can consume her.

“When she’s on it, you can holler her name all day and she won’t hear,” Mrs. Campbell said.

Researchers worry that constant digital stimulation like this creates attention problems for children with brains that are still developing, who already struggle to set priorities and resist impulses.

Connor’s troubles started late last year. He could not focus on homework. No wonder, perhaps. On his bedroom desk sit two monitors, one with his music collection, one with Facebook and Reddit, a social site with news links that he and his father love. His iPhone availed him to relentless texting with his girlfriend.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

When he studied, “a little voice would be saying, ‘Look up’ at the computer, and I’d look up,” Connor said. “Normally, I’d say I want to only read for a few minutes, but I’d search every corner of Reddit and then check Facebook.”

His Web browsing informs him. “He’s a fact hound,” Mr. Campbell brags. “Connor is, other than programming, extremely technical. He’s 100 percent Internet savvy.”

But the parents worry too. “Connor is obsessed,” his mother said. “Kord says we have to teach him balance.”

So in January, they held a family meeting. Study time now takes place in a group setting at the dinner table after everyone has finished eating. It feels, Mr. Campbell says, like togetherness.

No Vacations

For spring break, the family rented a cottage in Carmel, Calif. Mrs. Campbell hoped everyone would unplug.

But the day before they left, the iPad from Apple came out, and Mr. Campbell snapped one up. The next night, their first on vacation, “We didn’t go out to dinner,” Mrs. Campbell mourned. “We just sat there on our devices.”

She rallied the troops the next day to the aquarium. Her husband joined them for a bit but then begged out to do e-mail on his phone.

Later she found him playing video games.

The trip came as Mr. Campbell was trying to raise several million dollars for his new venture, a goal that he achieved. Brenda said she understood that his pursuit required intensity but was less understanding of the accompanying surge in video game use.

His behavior brought about a discussion between them. Mrs. Campbell said he told her that he was capable of logging off, citing a trip to Hawaii several years ago that they called their second honeymoon.

“What trip are you thinking about?” she said she asked him. She recalled that he had spent two hours a day online in the hotel’s business center.

On Thursday, their fourth day in Carmel, Mr. Campbell spent the day at the beach with his family. They flew a kite and played whiffle ball.

Connor unplugged too. “It changes the mood of everything when everybody is present,” Mrs. Campbell said.

Unit 2: Lesson 7

Attached to Technology and Paying the Price

The next day, the family drove home, and Mr. Campbell disappeared into his office.

Technology use is growing for Mrs. Campbell as well. She divides her time between keeping the books of her husband's company, homemaking and working at the school library. She checks e-mail 25 times a day, sends texts and uses Facebook.

Recently, she was baking peanut butter cookies for Teacher Appreciation Day when her phone chimed in the living room. She answered a text, then became lost in Facebook, forgot about the cookies and burned them. She started a new batch, but heard the phone again, got lost in messaging, and burned those too. Out of ingredients and shamed, she bought cookies at the store.

She feels less focused and has trouble completing projects. Some days, she promises herself she will ignore her device. "It's like a diet—you have good intentions in the morning and then you're like, 'There went that,'" she said.

Mr. Nass at Stanford thinks the ultimate risk of heavy technology use is that it diminishes empathy by limiting how much people engage with one another, even in the same room.

"The way we become more human is by paying attention to each other," he said. "It shows how much you care."

That empathy, Mr. Nass said, is essential to the human condition. "We are at an inflection point," he said. "A significant fraction of people's experiences are now fragmented."

Title of Independent
Reading Book: _____

FICTION: Below, write a few sentences about how the actions of a character in your book might reflect the brain science we have learned about so far. Use specific examples from the text.

NON-FICTION: Below, write a few sentences about how an event or information in your book might reflect the concept of consequences. Use specific examples from the text.

Unit 2: Lesson 9
Assessing Sources

Name: _____

Date: _____

When you find a text you think you might use for research, you first need to assess it by asking these questions.

1. Assess the Text’s Accessibility

- Am I able to read and comprehend the text easily?
- Do I have adequate background knowledge to understand the terminology, information, and ideas in the text?

2. Assess the Text’s Credibility and Accuracy

- Is the author an expert on the topic?
- Is the purpose to inform or to persuade/sell?
- When was the text first published?
- How current is the information on the topic?
- Does the text have specific facts and details to support the ideas?
- Does the information in this text expand on or contradict what I already know about the topic?

3. Assess the Text’s Relevance

- Does the text have information that helps me answer my research questions? Is it information that I don’t have already?
- How does the information in the text relate to other texts I have found?

When you find a text you think you might use for research, you first need to assess it by asking these questions.

1. Assess the Text’s Accessibility

- Am I able to read and comprehend the text easily?
- Do I have adequate background knowledge to understand the terminology, information, and ideas in the text?

2. Assess the Text’s Credibility and Accuracy

- Is the author an expert on the topic?
- Is the purpose to inform or to persuade/sell?
- When was the text first published?
- How current is the information on the topic?
- Does the text have specific facts and details to support the ideas?
- Does the information in this text expand on or contradict what I already know about the topic?

3. Assess the Text’s Relevance

- Does the text have information that helps me answer my research questions? Is it information that I don’t have already?
- How does the information in the text relate to other texts I have found?

Entry Task:
Getting an After-School Job

.....
Name:

.....
Date:

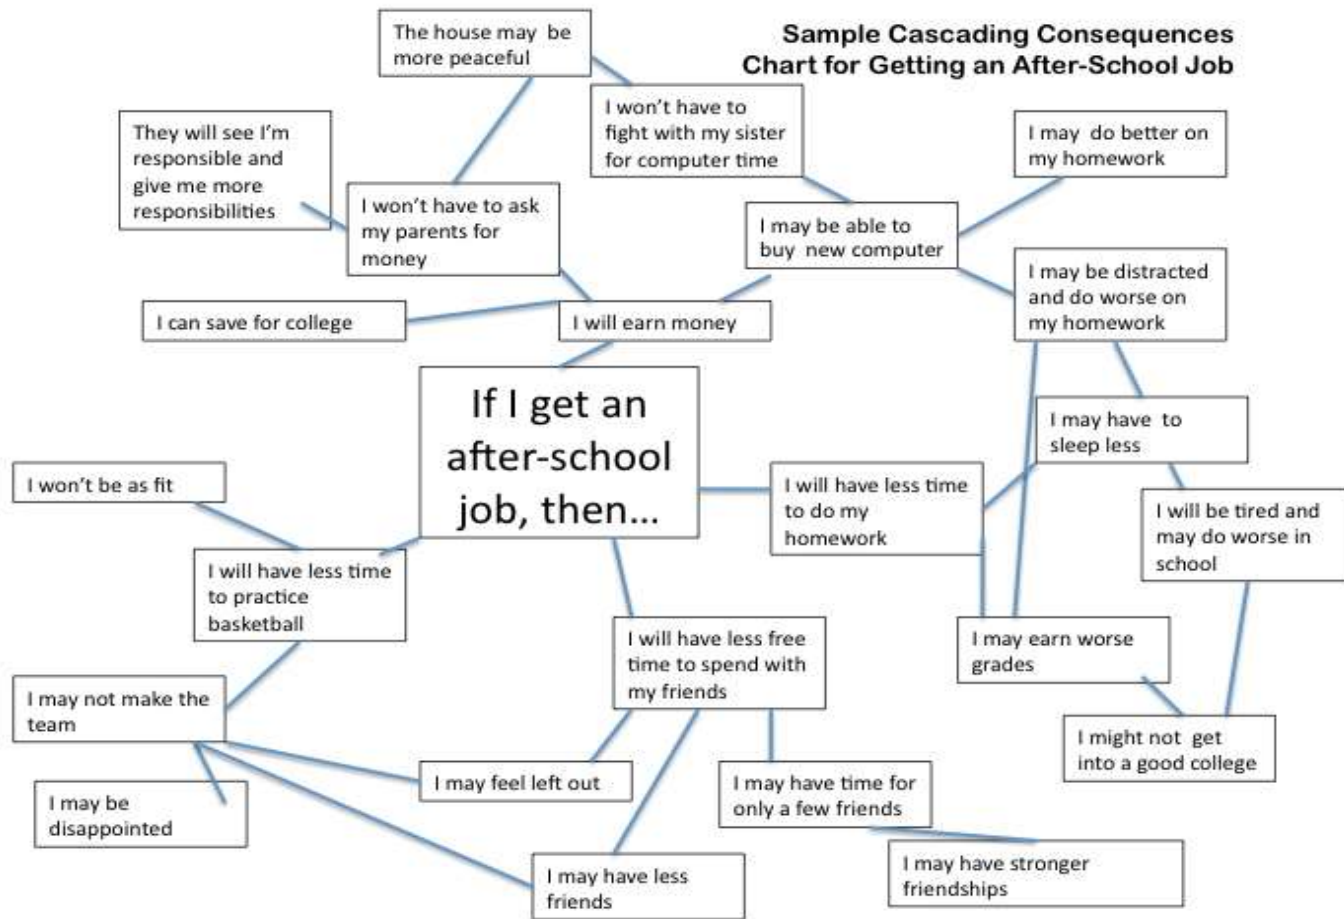

Imagine you are deciding whether to get an after-school job.

List all the consequences (effects) of this decision.

Based on these consequences, what would you decide?

Why would you make that decision?

Unit 2: Lesson 13 Sample Cascading Consequences Chart

Unit 2: Lesson 13
Listing Consequences

Name: _____

Date: _____

Directions: Use this list of sources to help you brainstorm consequences. You will not put all of them on your Cascading Consequences chart. Instead, brainstorm all possible consequences and choose the five strongest to “cascade” out.

Source	Consequence (write at least two for each source)
“Teens and Decision Making”	
“Insight into the Teenage Brain”	
“The Digital Revolution and the Evolution of the Adolescent Mind”	
“Growing Up Digital”	
AAP recommendation	
“The Many Benefits of Playing Video Games”	
“Children Could Be Better Off Playing Video Games”	

Unit 2: Lesson 13
Listing Consequences

Source	Consequence (write at least two for each source)
“Gaming Can Make a Better World”	
Aric Sigman video	
“Attached to Technology and Paying the Price”	
“Guest Opinion: Step Away from the Screen”	
Another source:

Unit 2: Lesson 14

Sample Comparing Risks and Benefits Chart for an After-School Job

Name: _____

Date: _____

What is the option being considered? To get an after-school job

Is the consequence positive or negative?	In what way will the stakeholder be affected? “ ____ so then _____ ”	Is this an intended or unintended consequence?	How serious is this consequence? 3-very 2-somewhat 1-not so much	Is this consequence outweighed by other consequences? If so, which ones?
+	I will have more money—so then I’ll be able to save up money for a computer.	intended	3	No
-	I will have less time to do homework—so then I will have to do it before school.	unintended	3	Yes—the money I will have. I can wake up early.
-	I will have less time to practice basketball so then I won’t get as much exercise.	unintended	2	Yes—the money I will have.

Unit 2: Lesson 14 Comparing Risks and Benefits Chart for Teens on Screens

Is the consequence positive or negative?	In what way will the stakeholder be affected? “_____ so then _____”	Is this an intended or unintended consequence?	How serious is this consequence? 3-very 2-somewhat 1-not so much	Is this consequence outweighed by other consequences? If so, which ones?

Unit 2: Lesson 14 Comparing Risks and Benefits Chart for Teens on Screens

Is the consequence positive or negative?	In what way will the stakeholder be affected? “ ____ so then _____ ”	Is this an intended or unintended consequence?	How serious is this consequence? 3-very 2-somewhat 1-not so much	Is this consequence outweighed by other consequences? If so, which ones?

Unit 2: Lesson 15

Cascading Consequences in Action

Prompt:

You are part of the Children and Media Expert Advisory Committee. Your job is to help the American Academy of Pediatrics decide whether to make an official endorsement of Facebook's current policy that children must be 13 to get a Facebook account. After examining both the potential benefits and risks of a Facebook account, particularly to the neurological development of teenagers, make a recommendation. Should the American Academy of Pediatrics officially recommend that Facebook raise the minimum age to 18 or endorse the policy as it stands at the age of 13?

Here is a sample body paragraph. Can you see the cascading consequences chart at work?

The third reason that the AAP should recommend that Facebook raise its minimum age has to do with synaptic pruning. The adolescent brain is in a dynamic stage of development. It is pruning unnecessary synapses and cementing other neurological pathways (Teens and Decision Making). A large part of our brain is dedicated to reading social cues because this skill is very important to leading a successful life (Giedd). However, this skill is not automatic. A teenage brain needs time and practice to build these pathways. There are many social skills that cannot be learned online because they are very subtle and require physical proximity (Giedd). These are such things as reading body language, facial expressions, or tone of voice. If someone is spending many hours a day interacting with others on Facebook, then he or she is missing out on an opportunity to build in-person skills. As Facebook becomes more and more popular, teens may use it as a substitute for in-person socializing and spend less time together. If they do that, then they will be pruning very important synapses that are necessary for human interacting. If the age limit for Facebook is raised, then teenagers will be more likely to find a social outlet that nourishes that part of the brain.

Unit 2: Lesson 15
 Position Power-Talk:
 Source Checklist

Name: _____

Date: _____

Directions:

During your discussion today, you will want to back up your evidence and reasoning with sources. Each time you refer to a source, put a checkmark next to it. Use your researcher’s notebook, neurologist’s notebook, or Brain Development anchor chart to help you.

My Sources

Unit 2: Lesson 15

Teens and Screens Fishbowl Graphic Organizer, Part I

Name: _____

Date: _____

Claim: The AAP should keep the recommended daily entertainment screen time at two hours.

Evidence	
<p>How does screen time affect the development of teenagers?</p>	<p>What are the negative consequences (or risks) for teens on screens?</p>
<p>What are the benefits of screen time that can still be obtained through two hours of daily use?</p>	<p>Using the information in the three other boxes, summarize here why the recommended daily entertainment screen time should be two hours.</p>
<p>If you are a listener instead of a participant in the Fishbowl discussion today, take notes on what you hear in this space.</p>	

Unit 2: Lesson 15

Teens and Screens Fishbowl Graphic Organizer, Part II

Name: _____

Date: _____

Claim: The AAP should raise the recommended daily entertainment screen time to four hours.

Evidence	
How does screen time affect the development of teenagers?	What positive consequences (benefits) are there for teens on screens?
In what specific ways do the benefits outweigh the negative consequences (risks) for teens on screens?	Using the information in the three other boxes, summarize here why the AAP should raise the recommended daily entertainment screen time.
If you are a listener instead of a participant in the Fishbowl discussion today, take notes on what you hear in this space.

Fishbowl Statement

.....
Date:

Using your Teens and Screens Fishbowl graphic organizer, Part I or Part II as a guide, respond to one of the following prompts, depending on which topic you have been selected to defend:

- If you are supporting the claim that the AAP should keep the recommended screen time to **two hours**, respond to this prompt:

Pretend it is just before class and a classmate in the hallway says, “The AAP should clearly raise its limit to four hours. It just makes sense!” Now, in a paragraph below, use logic and reasoning to prove your classmate wrong. Imagine you are responding to the comment and advocate for the position that the daily recommended screen time should be two hours.

- If you are supporting the claim that the AAP should raise the recommended screen time to **four hours**, respond to this prompt:

Pretend it is just before class and a classmate in the hallway says, “The AAP should clearly keep the limit to two hours. It just makes sense!” Now, in a paragraph below, use logic and reasoning to prove your classmate wrong. Imagine you are responding to the comment and advocate for the position that the daily recommended screen time should be four hours.

Entry Task, Lesson 18

Name:

Date:

Directions: Read over the feedback you received on the End of Unit 2 Assessment, Part 1 and the criteria that your teacher will use to assess your presentation (the End of Unit 2 Assessment, Part 2). Based on those documents, answer the questions below.

1. What is one skill that is a strength for you?
2. How will that skill help you in your presentation (End of Unit 2 Assessment, Part 2)?
3. What is one skill that is challenging for you?
4. What can you do to make sure you improve on that skill for your presentation (End of Unit 2 Assessment, Part 2)?

Name: _____

Unit 2: Lesson 19
Exit Ticket

Date: _____

Congratulations! You have completed your presentation. Take a few minutes to reflect on how you did. Below each of the learning targets below, circle how well you feel you did.

- **I can present my claim about the AAP recommendation using facts, details, and examples.**

I did very well. I did well. I did OK. I struggled with this.

- **I can use effective speaking techniques in my presentation.**

I did very well. I did well. I did OK. I struggled with this.

- **I can include a multimedia visual display in my presentation to clarify my claim and add emphasis.**

I did very well. I did well. I did OK. I struggled with this.

- **I can use formal English in my presentation.**

I did very well. I did well. I did OK. I struggled with this.

- **I can use my experience and knowledge of language and logic to advocate persuasively.**

I did very well. I did well. I did OK. I struggled with this.

Name one thing you did today as a presenter or an audience member that you're proud of:
